(anticancer) myeloablative therapy (bone marrow or whole-body irradiation or chemotherapy) to reconstitute the haematopoietic system; enrichment of progenitor cells (e.g. during ax vivo purging of malignant cells); treatment of tissues containing haematopoietic progenitors for subsequent transplant to improve haematopoietic competence; improving transfer of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         exogenous DNA to progenitor cells (in gene therapy of various haematological disorders, e.g. sickle-cell anaemia); and protection against ablative therapy (to eliminate proliferating cells specifically), followed by re-establishment of differentiation and proliferation of preserved progenitors. The protein, when linked to magnetic beads, may also be used to to isolate cells that express the FLK2/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                      The present sequence represents a lectin derived progenitor cell preservation factor. The protein is used to preserve unipotent, pluripotent or totipotent progenitor cells, especially hammatopoietic cells, and also progenitors from nerve, muscle, skin, gut, bone, kidney, liver, pancreas or thymus. Specific applications are preservation of cultured cells intended for administration after
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 DSAVLTSFDTIINFEISTPYTSRIADGLAFFIAPPDSVI--SYHGGFLGLFPNANTLNNS 118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a
                                                                                                                                                                                                                                                                                               The present sequence represents a FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of chemotherapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment reduces the hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymmal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics and preferably recover from center.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.

The present sequence represents fusion protein of alpha-amylase inhibitor signal peptide and FRIL (FIRZ/FIL3 tyrosine kinsse receptor-interacting lectin). The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatments Administration of a therapeutic treatment having a hematopoietic progenitor cell-depleting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer therapeutics

Example 5; Page 81; 173pp; English.

The present sequence represents a FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of reducing the hematopoietic progenitor cell-depleting activity of chemotherapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of a patient with a cherapeutic treatment of the patient. FRIL family members are useful for reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for solating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.

The present sequence is that of a jack bean concanavalin A (Con A) mutein in which the Asn-152 residue of the native protein is replaced by Ser in order to disrupt a glycosylation signal. The present invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing DNA that codes for at least 1 lectin selected from Con A (see AAX58736), modified Con A and pea lectin (see AAX58738); transgenic plant cells containing at least 1 copy of the DNA; the present lectin derived from the jack bean Con A gene; a method of imparting lectin derived from the jack bean Con A gene; a method of imparting beetles of the genus Meligethes, flea beetles of the genus Phyllotreta, and root flies of the genus Delia; and a method for protecting a plant against infestation by insects of these genera.

pentameric structures. However, pentaxins resemble more closely legume lectins such as concanavaline A and pea lectin. Alignment of sequences on the basis of topologically equivalent features of the three dimensional structures shows that helices occupy different positions in the pentraxins and legume lectins and that the amino acid sequences of the two families have identities of only approx. Il% The two main helices in SAP occur before and after strand L, whereas the

All these proteins show structural homology and may be used in the molecular design of a molecule for the inhibition of serum amyloid p (SAP) binding to amyloid fibrils. The similarities in the amino acid sequences of SAP, human and Limulus C-reactive protein (CRP) and female hamster protein suggests that they may have similar 3-D structures. The jellyroll topology of the pentraxins is reminiscent of the picornavirus coat proteins which also have

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in medicine. The lecture is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by proliferation, for the reduction and/or treatment of cancer, and/or the reduction and/or treatment of metabolic disorders. It is especially useful for the treatment of mucositis in mammalian cells and/or tissues (especially mucous cells including mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The
helices in the legume lectins occur at the C-terminus of strand J. There is a long insertion between the end of the helix after strand D and the begining of strand E in the lectins relative to pentraxins. Strands G, H and I together with the type IV beta-hairpin between H and I are identical in both SAP and pea lectin. The so-called pentraxin octapeptide signature sequence, HXXXS/TWXS, is in this region so it is not conserved in the legume lectins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to Robinia pseudoacacia lectins which can be used

The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially useful for the treatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous cells including mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a polypeptide subunit of R. pseudoacacia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially particularly human cells and/or tissues, particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not admage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a R. pseudoacacia lectin RebAI. This lectin is composed of two subunits- polypeptide a and polypeptide bill ectin is continued.

The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of mecositis in mammalian cells and/or tissues, useful for the treatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with rytotoxic drugs and radiation. The present sequence represents a R. pseudoacacia lectin RPPAII. This lectin is composed of the subunit- polypeptide c (AAY06813).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ST-VVSTFETTFTFQISTPYTSPPGDGLAFFLAPYDTVIPPNSAGNLLGLFPNLNALRNS 120

Lincoln lectin. The invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing DNA that codes for at least 1 lectin selected from Con A (see AAY58736), modified Con A (see AAY58737) and pea lectin; transgenic plant cells containing at least 1 copy of the DNA; a new lectin derived from the jack bean Con A gene; a method of imparting resistance to insects selected from blossom beetles (pollen beetles) of the genus Meligethes, flea beetles of the genus byllotreta, and root flies of the genus Delia; and a method for protecting a plant against infestation by insects of these genera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2 QSVSFTFTKFDSDQKDLMFQGHTISSSNVIQLTKLDSNGNPVSTSVGRVLYSAPLRLWES 61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is that of a Bauhinia purpurea lectin which has had lysine residues replaced by other amino acids which either preserve the positive charge at the position of the substitution or provide a neutral residue. The protein derivs, are effective larvicides against insect pupae, such as the European corn borer. The protein can be administered enterally to the larvae in their diet and can be see also AAR45912.

The invention describes compounds derived from Bauhinia purpurea lectin (BPL), a 262 amino acid peptide comprising 7 lysine residues - the present sequence) by the replacement of one or more lysine residues with other amino acid residues which either preserve the positive charge or provide a neutral residue at the point of substitution. The compounds are useful as larvicides against insects such as the European corn borer (Ostrinia nubilalis). The compounds may be used to protect commercial and field crops from insect larvae infestation, especially by the European corn borer. The BPL-derivatives are effective against insects which may be resistant to the naturally occurring form of BPL. Crops which may be protected using the BPL derivatives are corn/maize (Zea mays), rye, barley, wheat (Triticale sufflower, alfalfa, rapessed and soybean), fiber crops (such as onion, pepper, tomato, cucumber, squash, carrot, crucifer (e.g. cabbage, broccoli and cauliflower), eggplant, spinach, potato and lettuce). The compounds are useful for protecting species from the genera critical Lotus, Medicago, Onobrychis, Trifolium, Trigonella, Vigna, Planter, Linna Geranium Anaioct Barbidonsis processiva
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Citrus, Linum, Geranlum, Manicot, Dauccus, Arabidopsis, Brassica, Arabhanus, Sinapis, Atropa, Capsicum, Dafura, Hyoscyamus, Lycopersicon, Nicotiana, Solanum, Petunia, Digitalis, Majorana, Cichorium, Helianthus, Lactuca, Bromus, Asparagus, Antirrhinum, Hemerocallis, Nemesia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pelargonium, Panicum, Pennisetum, Ranunculus, Senecio, Salpiglossis,
Cucumis, Browallia, Glycine, Lolium, Triticum and Datura. The present
sequence represents the B. purpurea native lectin sequence.

Sequence 77, Application US/09228986
Patent No. 6359198
GENERAL INFORMATION:
APPLICANT: Strabala, Timothy
APPLICANT: Nieuwenhuizen, Niels
TITLE OF INVENTION: Compositions Isolated from Plant Cells
TITLE OF INVENTION: and Their Use in the Modification of Plant Cell Signalling
FILE REPERENCE: 11000/1020
CURRENT APPLICATION NUMBER: US/09/228,986
CURRENT FILING DATE: 1999-01-12
NUMBER OF SEQ ID NOS: 130
SOFTWARE: Fastseq for Windows Version 3.0
SOFTWARE: Fastseq for Windows Version 3.0

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

a therapeutic treatment. Including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment baving a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoletic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lectin derived progenitor cell preservation factor; progenitor cell; haematopoietic cell; cultured cell preservation; anticancer therapy; myeloablative therapy; sickle-cell anaemia; ablative therapy protection;
                                                                                                                                                                                                                                      The present sequence represents a FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoletic progenitor cell-depleting activity of
preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer therapeutics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NSMAVSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSPT 120

The present sequence represents a lectin derived progenitor cell
preservation factor. The protein is used to preserve unipotent,
cells, and also progenitors from nerve, muscle, skin, gut, bone,
cells, and also progenitors from nerve, muscle, skin, gut, bone,
cells, and also progenitors from nerve, muscle, skin, gut, bone,
kidney, liver, pancreas or thymus. Specific applications are
cells, and reconstitute the neamarow or whole-body Irradiation
continued cells (e.g. during ex vivo purging of malignant cells);
contemporate to improve haematopoietic progenitor cells);
creatment of tissues containing haematopoietic progenitors for subsequent
creamment of tissues containing haematopoietic progenitors for subsequent
creamment to improve haematopoietic competence; improving transfer of
creammatological disorders, e.g. sickle-cell anaemia); and protection
caqainst ablative therapy (to eliminate proliferating cells specifically),
collowed by re-establishment of differentiation and proliferation of
preserved progenitors. The protein, when linked to magnetic beads, may
also be used to to isolate cells that express the FLK2/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 NSMAVSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLY--SNVFRNS 118

receptor interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoletic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or cell-depleting activity of a therapeutic treatments. Administration of FRIL compositions to a patient prior to treatments of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient with a conjustion of the patient with a therapeutic treatment of the patient. FILL family members are useful for their population of progenitor cell-depleting activity alleviates or the mematopoletic progenitor cell-depleting activity alleviates or therapeutic treatment in the patient. FILL family members are useful for isolating oppulation of progenitor cells, hemangloblasts, and mesenchymmal depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics and preferrably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients having, or predisposed to developing and another and prefer having a condition where the patients hematopoletic progenitor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                      FRIL; FIK2/Flt3 tyrosine kinase receptor-interacting lectin; progenitor cell preservation factor; radiotherapy; chemotherapy; progenitor cell; hemangioblast; mesenchymal stem cell; cancer; severe combined immunodeficiency; aplastic anemia; tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     present sequence represents a FRIL (F1K2/F1t3 tyrosine kinase
                                         Amino acid sequence of a hyacinth bean FRIL polypeptide.

The present sequence represents fusion protein of alpha-amylase inhibitor signal peptide and FRII (FIK2/FIt3 tyrosine kinase receptor-interacting lectin). The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition cell-depleting activity of a therapeutic treatment, including a therapeutic and/or chemotherapeutic treatment. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment of the patient with call depleting activity of the therapeutic treatment in the patient. The cell-depleting activity of the therapeutic treatment in the patient. The cell-depleting activity of the therapeutic treatment in the patient. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopotetic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.

286 AA;

Sequence

Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer

reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                           NSMAVSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLYSNV--FRNS 118

The present sequence is that of the concanavalin A (Con A) lectin of jack bean. The present invention relates to: a transformed brassica plant that is resistant to certain insect pests, an expression cassette containing DNA that codes for at least lectin selected from Con A, modified Con A (see AAY58737) and pea lectin (see AAY58738); transgenic plant cells containing at least copy of the DNA; a new lectin derived from the jack bean Con A gene; a method of imparting resistance to insects selected from blossom beetles (pollen beetles) of the genus Meligethes, fleablessom con the genus PAP1 is an expected of the genus APP1 is an expected of the genus APP1 is an expected of the genus APP1 is an an method for protecting a plant against infestation by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Concanavlin A; Con A; lectin; jack bean; insecticide; transgenic plant; Brassica; insect resistance; mutant; mutein.

```
The present sequence is that of a jack bean concanavalin A (Con A) mutein in which the Asn-152 residue of the native protein is replaced by Ser in order to disrupt a glycosylation signal. The present invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing DNA that codes for at least 1 lectin selected from Con A containing DNA that codes for at least 1 lectin selected from Con A plant cells containing at least 1 copy of the DNA; the present lectin derived from the jack bean Con A gene; a method of imparting resistance to insects selected from blossom beetles (pollen beetles) of the genus Meligethes, flea beetles of the genus Phyllotreta, and root flies of the genus Delia; and a method for protecting a plant against infestation by insects of these genera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      62 SMAVSSFETNLTIQISTP--HPYYAADGFAFFLAPHDTVIPPNSWGKFLGLY--SNVFRN 117
